

Our Organization

AccentGSA is an information systems architecture and management consulting firm specializing in large scale federal software system implementation and integration efforts. Our software engineering process, the *Natural Process*, provides us with the unique capabilities to architect, manage, and implement high-volume and high-complexity information systems on a firm-fixed price (FFP) or performance basis. Our distinctive professional approach allows us to deliver effective solutions with higher quality, lower risk, and lower total cost of ownership.

Our Leadership Team

The AccentGSA leadership team has extensive experience building and managing successful software systems in both public and private sector environments. The team comes from successful careers at organizations such as IBM, SAIC, and CSC with experience at federal and state government levels, including Treasury, IRS, NOAA, NIH, DoD, Air Force, CIA, State of Maryland OAG, and others.

The management team not only sets the vision for the organization, but maintains active participation in mentoring leadership in our professionals. Our management structure is similar to that of a professional law or engineering practice, as opposed to the conventional IT general services organization. This requires a greater depth of practical experience from our management team and ensures that our professionals maintain higher standards of professionalism, quality, and success.

Our Clients

We have ongoing contracts at the Internal Revenue Service (IRS), National Oceanic and Atmospheric Administration (NOAA), Pearson Analytic Services, SAIC, NetUtry, and Trawick and Associates, performing duties ranging from software requirements analysis, design, alternatives analysis, program/project management support, quality assurance, independent validation and verification, technical white papers, and proposal support.

Our Approach

The Natural Process (NP) is a shift in paradigm from traditional software development methodologies and modern agile alternatives. It is a software engineering process (SEP) which incorporates science and engineering principles and provides a framework for demystifying software architecture. We are currently seeking process patents, CMMi certification, and endorsement from a major professional engineering organization.
